

Instruction Manual For The Fenix Mini Vaporizer by Weecke:

The bowl can be reached with a simple unclipping of the mouthpiece.

Fill the bowl with a fine grind and without packing the products for an optimal result. This allows a homogeneous air flow without the need to stir during the session.

Once the bowl is filled and mouthpiece snapped back in place:

- 5 successive presses within 2 seconds turns on the Fenix Mini and starts heating. It starts with a 4 minutes cycle before turning off automatically.
- The OLED screen indicates the actual temperature, and a red LED light softly glows through the mouthpiece to indicate the Fenix Mini is heating.
- Once your set temperature is reached, the screen stays fixed and the LED turns green.
- Now you can draw.
- Remember, just like with any vaporizer, the slower you draw the bigger the clouds will be and the stronger you draw the smaller the clouds will be because the air didn't have enough time to get properly heated.
- Fenix Mini will stay on for 4 minutes before turning off and a counter for seconds displays on the OLED screen.
- Your battery level and selected temperatures also appear on the OLED screen.
- To restart your Fenix Mini vaporizer, 5 successive presses within 2 seconds are required again.

Your session is over when no more vapor appears.
